Faculty of Humanities and Social Sciences

Notes Sharing System

A PROJECT PROPOSAL

Submitted to Department of Computer Application D.A.V. College

In partial fulfilment of the requirements for the Bachelors in Computer Application

Submitted by

Shreejal Shrestha 6-2-469-32-2024

June, 2026

CHAPTER 1: INTRODUCTION

Education has become increasingly dependent on digital resources, and students regularly use notes, PDFs, presentations, and other study materials to support their learning. However, these materials are usually shared through social media groups, messaging applications, cloud storage links, or personal contacts. As a result, students often face difficulties finding the notes they need, especially when preparing for assignments, internal assessments, or examinations. The lack of a centralized platform can make the process of accessing and managing study materials time-consuming and inconvenient.

The Notes Sharing System is a web-based application designed to provide an organized platform where students can easily share and access academic notes. Through this system, users can upload notes related to their course, semester, and subject, allowing other students to find relevant study materials more efficiently. To maintain the quality and authenticity of the content, all uploaded notes will be reviewed by an administrator before they are published on the platform.

In addition to note sharing, the system also includes several features that enhance the learning experience. Users can rate notes based on their usefulness, bookmark important materials for future reference, and search for notes using course and semester filters. The platform also provides a subject-wise quiz system where students can test their knowledge and evaluate their understanding of different topics. Features such as quiz leaderboards and wrong answer reviews help students monitor their progress and identify areas where improvement is needed.

Furthermore, the system includes light mode and dark mode options to provide a comfortable user experience based on individual preferences. By combining note sharing with learning and assessment features, the proposed system aims to create a more effective and organized academic environment for students.

The main goal of this project is to develop a reliable platform that simplifies the sharing of academic resources, encourages collaboration among students, and supports self-learning through easy access to study materials and interactive quizzes.

CHAPTER 2: PROBLEM STATEMENT

Students often face difficulties finding academic notes because study materials are scattered across social media platforms, messaging applications, and personal contacts. These resources are often unorganized, making it time-consuming to locate notes for specific courses and subjects.

Additionally, there is a lack of a centralized platform for sharing and managing academic notes. Students also have limited opportunities to evaluate their understanding through integrated learning tools.

Therefore, a Notes Sharing System is needed to provide organized access to study materials, ensure content quality through admin approval, and support learning through subject-wise quiz.

CHAPTER 3: OBJECTIVES

- To develop a web-based Notes Sharing System that enables students and teachers to upload, download, search, and manage academic notes based on course, semester, and subject.
- To implement note verification and assessment features, including admin approval, note ratings, bookmarks, and subject-wise quizzes with leaderboard and result tracking.

CHAPTER 4: METHODOLOGY

4.1. Requirement Identification

4.1.1. Study of Existing System

Some existing digital platforms that provide academic resources include:

- **Mero Notes**

Mero Notes is a digital educational platform that provides students with access to academic notes, study materials, model questions, and exam preparation resources from school to bachelor levels. The platform offers subject-wise notes, syllabus-based content, and learning materials designed according to the latest curriculum. Its goal is to simplify learning by making high-quality educational resources easily accessible to students across Nepal [1].

- **TU Papers**

TU Papers is an online platform developed for students of Tribhuvan University that provides previous years' question papers, syllabi, notes, and other academic resources in an organized format. The system allows students to access semester-wise and year-wise examination papers, helping them prepare effectively for upcoming examinations. By offering centralized access to academic materials, TU Papers improves the efficiency of exam preparation and study planning [2].

- **Uni Bytes**

Uni Bytes is a student-focused educational platform that aims to support university students by providing study resources, academic updates, and learning materials in a centralized environment. The platform facilitates easy access to notes, educational content, and university-related information, helping students stay informed and better prepared for their academic activities. Through its digital approach, Uni Bytes promotes convenient and efficient learning experiences for higher education students [3].

4.1.2. Requirement Collection

Functional Requirement:

- Notes upload and download – Users can upload notes and download study materials shared by others
- Notes management – Users can manage their uploaded notes
- Admin approval – Admin can review and approve notes before publishing
- Search and filter options – Users can search notes by course, semester, and subject
- Rating system – Users can rate notes based on usefulness
- Bookmark system – Users can save important notes for later use
- Quiz system – Users can take quizzes based on subjects

Non-Functional Requirements:

- The system verifies user identities and grants permissions according to assigned roles.
- Secure and reliable system
- Works smoothly on desktop and web browsers

4.2 Feasibility Study

4.2.1. Technical Feasibility:

The front end of this web application will be developed with HTML, CSS and JavaScript and for server-side development, we will use PHP. A database named MySQL will be used to store user data, notes, and quiz content. These technologies are used very widely and can run on any normal web browser without requiring any special hardware or software. A local server (like XAMPP) will be used for development and testing.

4.2.2. Operational Feasibility:

The system can easily be used by a student and administrator. Users can easily upload, search for, and access notes using simple interfaces such as dashboards, forms, and filters. The administrator can also manage and moderate content very easily. Ultimately, the system helps students better share study material and access material and is usable with limited training.

4.2.3. Economic Feasibility:

The economic feasibility of the system is achieved by the use of open-source technologies like PHP, HTML, CSS, JS, and MySQL. This reduces the cost of development significantly. In addition to low hosting and deployment costs, the system's automation of note sharing and management saves both students and administrators time and effort.

4.3 High Level Design of System

i. Methodology of the proposed system

The Waterfall Model will be used for the development of the Notes Sharing System. This model follows a sequential approach where each phase is completed before moving to the next phase. Since the requirements of the system are clearly defined, the Waterfall Model is suitable for planning, designing, developing, and testing the application in an organized manner.

Figure 4.1: Waterfall Model

ii. Data Flow Diagram

Figure 4.2: Level 0 DFD of Notes Sharing System

The Level 0 DFD represents the entire Notes Sharing System as a single process, showing only the two external entities user and admin and the data that flows between them and the system. The user interacts with the system by registering, uploading and downloading notes, taking quizzes, and rating or bookmarking notes, while the system returns approved notes, filtered notes list, quiz results, and leaderboard back to the user. The admin sends approval decisions, manages users and quiz questions, and in return receives pending notes, user data, and reports from the system.

Figure 4.3: Level 1 DFD of Notes Sharing System

The Level 1 DFD breaks the system into five sub-processes. Process 1 handles user registration and login using the Users Database. Process 2 manages note ratings and bookmarks through the Ratings and Bookmarks Database. Process 3 handles the quiz system by fetching questions, evaluating answers, and returning scores and leaderboard to the user. Process 4 manages note uploading, downloading, and searching through the Notes Database. Process 5 is the Admin Approval System where the admin approves or rejects pending notes, updating their status so only verified notes are visible to users.

iii. System Flow Chart

Figure 4.4: System Flowchart of Notes Sharing System

This flowchart illustrates a Notes Sharing System where users log in to access a central dashboard with four main options. Users can Upload notes (which require admin approval before publishing), Browse and download approved notes, take subject-based Quizzes to earn a score, or Rate and Bookmark existing notes to their collection. After completing any action, the user can either return to the dashboard to continue or log out to end the session.

iv. ER-Diagram

Figure 4.5: ER-Diagram of Notes Sharing System

The Notes Sharing System allows registered users to upload notes with details like title, subject, course, and semester, which are then reviewed and approved by an admin before becoming visible to others. Once approved, users can rate and bookmark notes they find useful. The system also includes a quiz module where quizzes contain multiple questions with four options each, and when a user takes a quiz, their score is automatically saved.

v. Use Case Diagram

Figure 4.6: Use Case Diagram of Notes Sharing System

The Notes Sharing System use case diagram consists of two actors: user and admin. The user must first register into the system, and since login is required for uploading notes, register includes Login using the include relationship. Once registered, the user can perform various operations such as uploading and downloading notes, searching for notes by subject or semester, bookmarking notes for future reference, rating notes, taking quizzes, viewing their quiz results, and viewing the leaderboard. The admin has access to administrative functionalities including approving or rejecting uploaded notes, managing existing notes, managing registered users, and managing quiz questions to ensure the quality and accuracy of the quiz content.

vi. System Architecture

Figure 4.7: System Architecture of Notes Sharing System

This architecture follows a 3-tier design where the Presentation Layer (HTML, CSS, JavaScript) provides the user interface, the Application Layer (PHP on Apache) processes user requests and business logic, and the Data Layer (MySQL) stores and manages data. The application can also use Gmail to send emails and notifications. This separation makes the system easier to maintain, secure, and scale.

CHAPTER 5: GANTT CHART

Figure 5.1: Gantt Chart of Notes Sharing System

The Gantt chart illustrates the project schedule for the Notes Sharing System from May 2026 to September 2026. Project documentation is carried out throughout the entire development period. Requirement collection and analysis begin in Week 3, followed by system design. The development phase consists of the User Module and Admin Module, with the User Module taking a longer duration. Testing and bug fixing are conducted alongside development to ensure system quality. The project concludes with a final review and submission in the last week of the schedule.

CHAPTER 6: EXPECTED OUTCOME

- A fully functional web-based Notes Sharing System that enables students and teachers to upload, download, and manage academic notes organized by semester and subject. The system includes an admin-moderated approval workflow to ensure that only verified and quality-checked notes are made available to users.
- An interactive quiz system that allows students to attempt subject-based quizzes, view their scores, and compete on a leaderboard. It also includes features such as note rating and bookmarking, enabling users to evaluate the quality of notes and save them to their personal collection for future reference.
- A complete implementation of CRUD (Create, Read, Update, and Delete) operations across all major modules, including user management, notes management, quiz management, and the admin approval system.
